### Item specifics

Classified: Iron Chondrite

Type: Iron Meteorite

Origin: Keller, Texas

## 100% AUTHENTIC Stony Chondrite Meteorite From Keller, Texas area

Bid and win 15 meteorites! These were found in the city of Keller, Texas. The larger piece weighs 19.9 grams, size: 30mm Long x 25mm Wide x 20mm Thick, and attracted to a strong neodymium rare earth magnet as are the other 14 smaller chondrites found around the same area. These make a great collection item for those who collect and study meteorites. The **darker areas** reveal old crust with shiny areas of irregular formation shaping of regmaglypt hollows from super heat and explosion of entry into Earth's atmosphere. I've collected and sold many meteorites on eBay and experts and collectors alike have always found my descriptions to be accurate just see pictures and feedback - it says it all.

### A little about Stony Meteorites.

Meteorites fall from space all the time in almost every location on Earth - most burn up but many make it to Earth as small as a grain of sand to 1mm in size or much larger. So, you can hunt and find meteorites using a strong magnet on a stick and discover them most anywhere you just have to have patience and know what you looking for. Chondrites are stony Meteorites and most people will walk right over one as most look exactly like a dark colored stone. Stony Iron-Nickel Meteorites are almost completely metallic, being composed of blended nickel and iron. These can be sliced and etched, revealing patterns of cross-hatched lines of metal flakes and other minerals, called Windmastatten figures. These meteorites are composed of the same material that forms the Earth's core, and they may come from the cores of destroyed planets or the planet forming bodies called planetesimals. They also contain silicate minerals, mostly Pyroxene and Olivine crystals, and small amounts of Plagioclase Feldspar. Their structure consists of small spherical grains called chondrules. The chemical make of Chondrites suggests they may come from the mantle of planetesimals. Chondrites can be carbon dated as being 4.6 billion years old, the estimated age of the solar system.

Collect or give it as a remembered gift of science where this piece traveled around the galaxy, our Sun and then fell onto Earth.
